

PREPARING YOUR SOIL FOR TURF

3 Install Irrigation

Install an irrigation system to ensure consistent water coverage for your turf. Choose an irrigation system that suits the size of your lawn and ensures even water distribution for healthy grass growth. (Sprinkler system e.g., Hunter, Rain Bird, Sumisoaker hoses).

4 Level the Ground

- Level the soil surface to ensure even water distribution.
- Use a lawn leveler to prevent low or high spots where water could collect or dry out.

5 Water the Soil

- Water the soil thoroughly before laying the turf, ensuring it's moist but not waterlogged. This helps settle the soil and creates a good environment for the grass roots to establish.

6 Apply Fertiliser

- Use a balanced, slow-release fertiliser, we recommend 2SPEC Establish to give your new turf a good start.

7 Lay Turf

- Lay the turf rolls or sod on the prepared soil.
- Stagger the seams of the turf in a brick pattern, laying it tightly together without overlapping. Press down the edges

8 Apply Kelpro and Hydrolink

- Apply Kelpro and Hydrolink Advance over the top of the turf.
- These products help improve water retention and promote healthier grass growth. Water thoroughly after installation. First time we recommend 6mm of water.
